While recent studies have highlighted the phenomenon and risks of increased inequalities between the top and the bottom of society, little research has so far been carried out on trends relating to the median income range that generally represents the middle class. This volume examines the following questions: what are the main transformations in the world of work over the last 20 years in terms of the labour market, social dialogue, and conditions of work, wages and incomes that may have affected the middle class? How has the middle class been altered by the financial and economic crisis? What are the long-term trends for the middle class in Europe? Writing on accidental injury often seems to occur from one of two perspectives. One perspective is that of those involved in aspects of injury diagnosis and treatment and the other is that of those in the engineering and biologic sciences who discuss mechanical principles and simulations. From our point of view, significant information problems exist at the interface: Persons in the business of diagnosis and treatment do not know how to access, use, and evaluate theoretical information that does not have obvious practical applications; persons on the theoretical side do not have enough real life field data with which to identify problems or to evaluate solutions. The ideal system provides a constant two-way flow of data that permits continuous problem identification and course correction. This book attempts to provide a state-of-the-art look at the applied bio mechanics of accidental-injury causation and prevention. The authors are recognized authorities in their specialized fields. It is hoped that this book will stimulate more applied research in the field of accidental-injury causation and prevention. Alan M. Nahum John W. Melvin vii Contents Preface . . . . . vii . . . . .
